

Data Appendix

7th May 2023

Raw Data

The raw daily (end of day) data has been acquired for each index from *investing.com* [18] with the exception for Switzerland. The Swiss volatility index data is from *onvista.de* [25]. The utilised data is 30-day implied volatility, calculated based on near-term and next-term option prices. [1] [7] As expected the VVFXI is implicit in the prices of its underlying FXI (iShares Trust FTSE China 25 Index Fund) options. However, the anomaly here is, that FXI – an instrument traded in NYSE Arca, New York – tracks Chinese equities traded on the Hongkong Stock Exchange and the VVFXI is traded at CBOE, Chicago. This will most certainly lead to subpar portrayal of China’s implied volatility. [3] [7] Also the tradable hours should be treated with caution. Many derivatives exchanges offer night sessions or OTC trades to their customers. However, since most of the (transparent) total volume is traded during the opening and closing periods of regular trading hours, our modelling assumption is therefore supported. [20] The data from Table 1 give a total of 2724 observations, and after omitting rows with NA values, 1017 remain. Since the data is split with the ratio $\frac{1}{3}$ and $\frac{2}{3}$, the training set for the EM algorithm consists of 1816 rows and the remaining algorithms are trained with a set of 687 rows. Both are tested with a set of 330.

Data availability statement: The dataset generated by combining the cited sources from *investing.com* and *onvista.de* is available in the Dataverse repository, [<https://doi.org/10.7910/DVN/IGW6RQ>].

²Sometimes referred to as AXVI.

³Sometimes referred to as Nikkei 225 VI.

Index ticker	Associated country	Short form	Underlying assets	Traded exchange	Tradable hours (UTC)	Available timeframe	Data source [accessed 27-April-2022]
